### **DETAILED ACTION**

## Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 2. Claims 1, 2, 4-7 are rejected under 35 U.S.C. 102(b) as being anticipated by Brewer et al. ("Brewer") (US Patent 5,255,324).

Regarding Claim 1, Brewer discloses an audio distortion processing system comprising: a first processing unit (Fig. 1, 15) adapted to be in communication with an audio source (13) wherein said first processing unit controls a plurality of parameters (Brewer discloses volume and bass parameters; Column 4, lines 12-16); a plurality of inputs in communication with said first processing unit (panel 11), said plurality of inputs respectively indicating values of said plurality of parameters (Col. 4, lines 7-9); a power amplifier (16 and 17) in electrical communication with said first processing unit for receiving an output signal of said first processing unit, said power amplifier selectively generating a clipping signal (signal to 18), said power amplifier adapted to be in communication with at least one speaker (20 through 23); a second processing unit in electrical communication with said power amplifier (10) and said first processing unit (15) for receiving said clipping signal from said power amplifier (signal from 18 to 10) and sending a control signal to said first processing unit (14); and an incremental reduction in a level of a first parameter of said plurality of parameters until one of either

Page 3

Art Unit: 2644

said clipping signal recedes or a reduction limit of said first parameter is achieved (Fig. 2, steps 25, 26, 27, 28, and 29) and incremental reduction in a level of a second parameter of said plurality of parameters if a reduction limit of said first parameter is achieved and said clipping signal persists (steps 25, 26, 30, 31, and 32).

Regarding Claim 1, Brewer discloses an audio distortion processing system comprising: a first processing unit (Fig. 1, 15) adapted to be in communication with an audio source (13) wherein said first processing unit controls a plurality of parameters (Brewer discloses volume and bass parameters; Column 4, lines 12-16); a plurality of inputs in communication with said first processing unit (panel 11), said plurality of inputs respectively indicating values of said plurality of parameters (Col. 4, lines 7-9); a power amplifier (16 and 17) in electrical communication with said first processing unit for receiving an output signal of said first processing unit, said power amplifier selectively generating a clipping signal (signal to 18), said power amplifier adapted to be in communication with at least one speaker (20 through 23); a second processing unit in electrical communication with said power amplifier (10) and said first processing unit (15) for receiving said clipping signal from said power amplifier (signal from 18 to 10) and sending a control signal to said first processing unit (14); and an incremental recovery of an original level of a second parameter if said clipping signal is not detected (Fig. 2, steps 33, 34, 35, and 36) and an incremental recovery of an original level of said first parameter ensues if said original level of a second parameter is recovered and said clipping signal is not detected (steps 37, 38, 39, and 40).

Regarding Claim 2, Brewer further discloses that the reference level (i.e. reduction limit) is a function of a first input (i.e. function of an operator input) (Column 4, lines 52-53).

Regarding Claim 4, Brewer further discloses said reduction limit of said second parameter is a function of said reduction limit of said first parameter (Figure 2, step 26 discloses second parameter is not reduced until first parameter, steps 27 and 28, are reduced to predetermined limit, i.e. second parameter is a function of predetermined limit of first parameter).

Regarding claim 5, Brewer further discloses a reduction limit of said second parameter (Volume) is equal to the difference between a maximum reduction limit of said second parameter (It is inherent that the maximum reduction limit of second parameter (Volume) is zero since a negative volume level is not possible) and said reduction limit of said first parameter (Brewer discloses in Figure 2, step 26 that the volume will not be reduced until the bass in steps 26-29 reach a predetermined limit (i.e. reduction limit of first parameter). It is at this point where the second parameter sill start to be reduced, therefore the limit.)

Regarding Claim 6, Brewer further discloses first parameter is a bass (Fig. 2, step 28) and a corresponding first input of the plurality of inputs is a operator selectable bass boost (Col. 4, lines 7-12)

Application/Control Number: 09/833,183 Page 5

Art Unit: 2644

Regarding Claim 7, Brewer further discloses the second parameter is volume (Fig. 2, step 31) and a corresponding second input of the plurality of inputs is operator selectable volume level (Col. 4, lines 7-12).

## Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claims 3 and 8-13 rejected under 35 U.S.C. 103(a) as being unpatentable over Brewer in view of Wassink (US Patent 5,633,940).

Regarding Claim 3, Brewer discloses a system as stated apropos of claim 1 above but does not disclose the reduction limit of said first parameter is equal to one half of said original level of said first parameter. Wassink also discloses detection of a clipping signal by a controller (5) and control panel 6 which also provides user control of bass and volume (Col. 3, lines 35-40) and that first the bass setting can be reduced then the volume setting (Col. 5, lines 50-53). Wassink further discloses the selection criterion for the on whether the next adjustment is to be a volume setting or a bass setting depends on levels set by the user (Col. 5, lines 44-50). Therefore, it would have been obvious at the time the invention was made for the reduction limit to equal half of an operator selectable first parameter level as a matter of design choice.

Page 6

Regarding Claim 8 Brewer discloses a method for controlling distortion in an audio system (Figure 1) having first (bass) and second (volume) parameters (Brewer discloses volume and bass parameters) (Column 4, lines 9-12) wherein each of said parameters is a function of an operator input (Brewer discloses switches controlling volume and bass through microcontroller 10) (Column 4, liners 7-12), said method comprising the steps of: determining a reduction limit of said first parameter (Brewer discloses a predetermined reference level, i.e. reduction limit, in step 26) (Column 4. lines 52-53), determining a reduction limit of said second parameter (Brewer discloses reduction of wideband gain, i.e. volume, is stopped when clipping distortion falls below the predetermined threshold (i.e. reduction limit of second parameter) (Column 5, lines 22-32); detecting a clipping signal in said audio system (Brewer discloses clip signal from amp 16 to interface 18); incrementally reducing a level of said first parameter until one of either said clipping signal recedes or said reduction limit of said first parameter is achieved (Brewer discloses Figure 2, steps 25-29, which discloses reducing level of the bass signal until no clipping (step 25) is present or reference is reached in step 26); incrementally reducing a level of said second parameter if said reduction limit of said first parameter is achieved and said clipping signal persists (Brewer discloses Figure 2 steps 30-32 where volume is reduced when bass is over reference value in step 26). Brewer discloses incrementally recovering the bass and volume parameters in steps 33 through 41 but does not disclose recovering first parameter (bass) if said original level of second parameter (volume) is fully recovered and said clipping signal is not detected. Art Unit: 2644

Wassink also discloses detection of a clipping signal by a controller (5) and control panel 6 which also provides user control of bass and volume (Col. 3, lines 35-40) and that first the bass setting can be reduced then the volume setting (Col. 5, lines 50-53). Wassink further discloses once clipping is not detected volume and bass settings can be increased in a reverse order to the order in which the setting have been reduced (Paragraph bridging columns 5 and 6). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to recover parameters in reverse order as disclosed by Wassink in order to provide a maximum audio output.

Regarding Claim 9, Brewer further discloses said first parameter is a bass parameter and said second parameter is a volume parameter (Figure 2, Steps 28 and 31).

Regarding Claim 10, Brewer further discloses that the reference level (i.e. reduction limit) is predetermined (i.e. function of an operator input) (Column 4, lines 52-53).

Regarding Claim 11, Wassink further discloses the selection criterion for the on whether the next adjustment is to be a volume setting or a bass setting depends on levels set by the user (Col. 5, lines 44-50). Therefore, it would have been obvious at the time the invention was made for the reduction limit to equal half of an operator selectable first parameter level as a matter of design choice.

Regarding Claim 12, Brewer further discloses said reduction limit of said second parameter is a function of said reduction limit of said first parameter (Figure 2, step 26

discloses second parameter is not reduced until first parameter, steps 27 and 28, are reduced to predetermined limit, i.e. second parameter is a function of predetermined limit of first parameter).

Regarding claim 13, Brewer further discloses said reduction limit of said second parameter (Volume) is equal to the difference between a maximum reduction limit of said second parameter (It is inherent that the maximum reduction limit of second parameter (Volume) is zero since a negative volume level is not possible) and said reduction limit of said first parameter (Brewer discloses in Figure 2, step 26 that the volume will not be reduced until the bass in steps 26-29 reach a predetermined limit (i.e. reduction limit of first parameter). It is at this point where the second parameter sill start to be reduced, therefore the limit.)

#### Conclusion

5. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any

Application/Control Number: 09/833,183

Art Unit: 2644

extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of

the advisory action. In no event, however, will the statutory period for reply expire later

than SIX MONTHS from the date of this final action.

6. Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Justin Michalski whose telephone number is (703)305-

5598. The examiner can normally be reached on 8 Hours, 5 day/week.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Bill Isen can be reached on (703)305-4386. The fax phone number for the

organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the

Patent Application Information Retrieval (PAIR) system. Status information for

published applications may be obtained from either Private PAIR or Public PAIR.

Status information for unpublished applications is available through Private PAIR only.

For more information about the PAIR system, see http://pair-direct.uspto.gov. Should

you have questions on access to the Private PAIR system, contact the Electronic

Business Center (EBC) at 866-217-9197 (toll-free).
